IMPROVEMENT OF THE PREPARATION PROCESS OF MULTICOMPONENT FODDER FOR SMALL CATTLE

Mohammad Alatoom

Postgraduate Student of Lugansk National Agrarian University, Lugansk, Ukraine

Summary. Existing constructions of fodder chopper-mixers for small cattle are considered. Appropriateness of the design of a modular feed-preparing machine is proved.

Key words: Working body, module, technological effectiveness of the structure.

PROBLEM

At present, one can state with certainty that the basic direction of animal husbandry in Jordan is sheep breeding. Dynamics of sheep population is the evidence of this.

Table 1. Dynamics of sheep population in Jordan according to the data of Food and Agriculture Organization of the United Nations (FAO)

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>

<tbody>
<tr>
<td>Number of animals, head</td>
<td>582000</td>
<td>1121000</td>
<td>1556000</td>
<td>2181939</td>
<td>1833986</td>
<td>2331850</td>
</tr>
</tbody>
</table>

As it can be seen from the data of FAO as of 2010, 2331850 head of sheep were numbered in Jordan which on average made 0.4 sheep per one person. In addition, farmers of Jordan raise goats; in 2010 their total livestock population made 881970 head. Due to this reason fodder preparation for feeding is a very burning task which requires scientific researches.

Currently, fodder preparation process for feeding small cattle is not studied thoroughly. Absence of diversity of alternatives of fodder chopper-mixers adapted to a definite manufacturing environment indicates this. Therefore, it is necessary to work out a science-based theory of design of such machines.

Analysis of recent researches and published works. The basic results of theoretical and experimental researches of the efficiency of fodder chopper-mixers are
given in the works of famous scientists: S.V. Melnikov, S.I. Nazarov, V.I. Perednya, L.P. Kartashov and others [1-4]. The works of these scientists are directed at the improvement of a working body which can chop several types of fodder and, at the same time, effectively mix ground components. However, in practice, chopping of concentrated fodder and roughage at the same time is not reasonable because fibrous materials of roughage decrease the impact force of nonground grains upon chopper’s working surfaces.

The aim of the research is to determine the ways for improvement of a manufacturing process of fodder chopper-mixers for small cattle.

Results of the research. Effective sheep breeding is impossible without using multicomponent fodder (fodder mixtures) in ration. Composition of loose fodder mixtures for small cattle is the following: 20 – 40% straw, 12 - 26 – hay, 40 - 60 – silage, 7 - 17% – mixed fodder.

Composition of pelleted fodder mixtures for small cattle is the following: 35 - 50% – straw, 18 - 30 – grass meal, 20 - 40 – hay and grain fodder, 14 – 20% – mixed fodder.

Each component of a fodder mixture must correspond to definite zootechnical requirements which regulate: size of particles, number of admixtures, moisture and etc. In most cases, for manufacture of multicomponent fodder mixtures it is necessary to mix components which differ considerably by size features, see table 2.

<table>
<thead>
<tr>
<th>Type of fodder</th>
<th>Size of particles, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hay, straw</td>
<td>20-30</td>
</tr>
<tr>
<td>Silage, haylage</td>
<td>up to 50</td>
</tr>
<tr>
<td>Concentrated fodder</td>
<td>1-1.5</td>
</tr>
<tr>
<td>Tuberous roots</td>
<td>10-15</td>
</tr>
</tbody>
</table>

Taking into consideration the above-mentioned facts, we can say that increase of the efficiency of a mixing process of fodder for small cattle can be achieved using a mixing working body which can move effectively groups of particles of different size from one position into another. Moreover, an effective mixer must provide a continuous technological process with minimal energy and human resources expenses. It is also very important to take into account the fact that a fodder mixture of high quality can be obtained only from properly ground components.

The process of chopping and mixing of fodder mixture components for small cattle is effective only at a definite rotational frequency of a working body of a machine, see table 3.

<td>25-300</td>
</tr>
<tr>
<td>Concentrated fodder</td>
<td>980-1250</td>
<td>70-400</td>
</tr>
<tr>
<td>Tuberous roots</td>
<td>500-1000</td>
<td>275-350</td>
</tr>
</tbody>
</table>
As it can be seen from table 3 the rotational frequency of a working body is different for various fodder mixture components, though, despite such conditions, attempts are made to create fodder chopper-mixers which can provide rational modes of chopping and mixing during manufacture of multicomponent fodder mixtures.

It is necessary to make an analysis of the existing constructions of these machines in order to define the most rational construction of a fodder chopper-mixer for small cattle. The process of chopping and mixing is carried out simultaneously by a single working body of chopper-mixers. At present, the fodder chopper-mixer ISK-3 is very widespread (fig. 1).

The machine consists of a blade rotor 2; an inlet chamber I, a working chamber II and an unloading chamber III situated one above another; a bunker; an unloading conveyor 3; a set of countercuts 7; toothed decks 1; an electric motor and a V-belt drive equipped with a belt idler. Two nozzles 6 at an inlet and two of them at an unloading chamber are provided for the injection of liquid additives into the work bulk. The inlet and working chambers are connected by flip-up mounts. There are six openings in the walls of a working chamber where sets of blade-countercuts and toothed decks are installed.

Chopper’s blades, which are used as mixers, and hammers are situated on a working body-rotor. A two-blade spinner is situated in the lower part of the rotor situated in the unloading chamber.

A set of blade-countercuts is gathered at the shaft which is installed in a jointed position on the basis mounted to the body of the working chamber by bolts. In case if extraneous objects get into the chamber, a hinged spring mount of countercuts allow them to deflect without a breakdown and let solid objects in.
The productivity of the machine which works at mixing can reach 25 t/h, at mixing with partial regrinding – up to 5 t/h, at chopping, for example, of straw – up to 3-4 t/h at the cutting length of up to 30 mm and 4-8 t/h at the cutting length of 50 mm.

The chopper-mixer provides mixing of silage, straw, edible roots and mixed fodder with a degree of homogeneity – 80-90%; engine’s installed capacity is 39.2 kW; rotor’s rotational frequency – 17 c-1; machine’s dimensions –1600x1090x1150 mm; weight with an unloading conveyor – 2200 kg. The chopper-mixer is operated by one worker.

Advantages of ISK-3:
- continuity of the process;
- simplicity of the construction;
- chopping and mixing is carried out simultaneously;
- protection against consequences in case if extraneous objects get into the working zone;
- high homogeneity of mixture.

Disadvantages of ISK-3:
- high energy intensity of the process of fodder mixture preparation;
- pelleted fodder can’t be added to a fodder mixture without being destructed;
- it doesn’t mix fodder with grass meal;
- it doesn’t chop concentrated fodder;
- the machine is stationary.

Fodder chopper-mixer-distributors are very widespread at present time. One of the disadvantages of ISK-3 has been removed; chopper-mixer-distributors are mobile machines. chopper-mixer-distributors are intended for preparation (loosening, partial chopping and mixing) and distribution (depending upon the used ration) of components (green bulk, silage, haylage, loose and pressed hay, liquid fodder additives) without a device for self-loading of components using an electronic system of weighting of fodder mixture components.

Working bodies of such machines are a twin-screw mixer with blades installed on its augers (fig.2).

The distinctive feature of these machines is a vertical or horizontal position of two augers of a higher pitch. It allows to obtain loose fodder mixture from several components. Availability of adjustable countercuts permits to change a degree of chopping of fodder mixture components. The productivity of such machines makes 12 t/h, bunker capacity – 12 m3, mixing time – 5-7 minutes; weight – up to 5300 kg; it is unitized with a 1.4-2 ton-force class tractor [5, 6].

Advantages of fodder chopper-mixer-distributors:
- high productivity;
- considerable body space;
- the machine is mobile;
- mixing time – 5-7 minutes;
- availability of an electronic system of weighting of fodder mixture components.
The productivity of the machine which works at mixing can reach 25 t/h, at mixing with partial regrinding – up to 5 t/h, at chopping, for example, of straw – up to 3-4 t/h at the cutting length of up to 30 mm and 4-8 t/h at the cutting length of 50 mm.

Advantages of fodder chopper-mixer-distributors:
- high productivity;
- considerable body space;
- the machine is mobile;
- mixing time – 5-7 minutes;
- availability of an electronic system of weighting of fodder mixture components.

Disadvantages of fodder chopper-mixer-distributors:
- the machine is of a sampling action;
- high energy intensity and materials consumption;
- low quality of chopping of roughage, stem and succulent fodder;
- chopping of concentrated fodder is impossible;
- low efficiency during mixing of concentrated fodder with roughage and succulent fodder.

It is possible to estimate technological effectiveness of the above-mentioned constructions of chopper-mixers with the help of a coefficient of block structure. Block coefficient $Cb$ increases technological effectiveness of the construction [1-4]:

$$Cb = \frac{\sum C_{aut}}{\sum C_t},$$

where: $\sum C_{aut}$ - number of the independent systems of the construction, table 4; $\sum C_t$ - total number of systems of the construction (loading, chopping with mixing, unloading).
The quantity of the operations carried out by a chopper-mixer.

In independent units (modules); the number of independent modules must correspond to the quantity of the operations carried out by a chopper-mixer.

It is evident that the number of independent modules must correspond to the quantity of the chopper-mixer for small cattle and its chopping units must be an independent module.

The analysis showed that equipping screw working bodies with blades doesn’t provide the necessary degree of chopping of all the components of a fodder mixture for feeding small cattle so one can suppose that a mixing working body of a fodder chopper-mixer for small cattle and its chopping units must be an independent module.

### CONCLUSIONS

1. Simultaneous chopping of concentrated fodder and roughage is not reasonable because fibrous materials of roughage decrease grain’s impact force upon the working surface of a chopper; that is why equipping screw working bodies with blades doesn’t provide the necessary degree of chopping of all the components of a fodder mixture for feeding small cattle.

2. An effective fodder chopper-mixer for small cattle must consist of several independent units (modules); the number of independent modules must correspond to the quantity of the operations carried out by a chopper-mixer.
