Stereotypes in the perception of cross-border business partners (on the example of Podlasie entrepreneurs)

Anna Tomaszuk

Abstract
The aim of the study was to determine whether the Podlasie entrepreneurs think about neighboring nations (Belarusian, Lithuanian, Ukrainian and Russian) in a stereotypical way (assigning them certain negative characteristics) and, if it affects in any way the decision about cooperation. The theoretical part of the article concerns the concept of stereotype, its features and functions. In the empirical part the results of research are presented. They were carried out on a group of Polish entrepreneurs (in Podlasie) in order to identify their attitudes and opinions on some neighboring nations (Russians, Belarusians, Lithuanians and Ukrainians). The research was a pilot study, the sample included two hundred entrepreneurs, the authors’ questionnaire was used. In the light of the study negative national stereotypes seem to have a great importance in creating cross-border networking.

Keywords
stereotype, national stereotypes, cross-border cooperation, entrepreneurs of Podlasie

Introduction
In recent decades, due to the continuous technological progress and increasing globalization, the number of companies and organizations operating in the markets wider than national has significantly increased (Gurgul & Lach, 2014). We have been witnessing the globalization, which have taken different forms (Qiu, 2010). For Podlaskie Province – because of its unique location close to Belarus, Lithuania, Ukraine and Russia (Kaliningrad) – the aspect of cross-border cooperation and appropriate assessment of frontier markets is particularly important.

A border location can be seen in two levels – it is often the cause of economic underdevelopment, but it can also be a factor affecting the development, because it provides the opportunity to establish direct cooperation with neighboring regions that belong to different national space, which in turn can be an asset for cooperating regions (Mieroslawska, 2004). Cross-border cooperation entails a number of challenges in the form of economic, legal and social barriers. The social barriers include negative experience from historical development, lack of residents’ psychological readiness to cooperate and differences in mentality (Pisarenko, 1998). Therefore, in order to strengthen the cooperation not only the burden of historical events, mutual prejudices and mistrust would need to be overcome, but also negative stereotypes (Soclab, 2013), which play an important role in intercultural communication (Fiske, 1988). The article addresses the issue of stereotypes and their significance, with particular emphasis on the role of national stereotypes. The potential impact of negative national stereotypes on the possibility of creating cross-border cooperation was investigated.
The study aimed to determine which of the selected negative features discourage entrepreneurs from cooperation and whether these features were present in respect to the nations: Belarusian, Lithuanian, Ukrainian and Russian. The research was a pilot study; the authors’ questionnaire was filled in by two hundred entrepreneurs from Podlasie.

1. SIGNIFICANCE OF STEREOTYPES

W. Lippmann was first who noticed the significance of stereotypes and define the term as „mechanisms ensuring the economy of description and perception of phenomena” (Lippmann, 1965). According to Lippman, people cannot achieve full mental representation of the outside world due to its complexity and react to it using simplified images, which are their window to the outside world (Kurcz, 1994). Stereotypes can be seen as beliefs about the attributes and behaviors of members of a social group (Hilton & Hippel, 1996). However, due to the fact that stereotypes may also describe the differences between two or more groups, they can be seen in the context of beliefs about group differences (Biernat & Candall, 1996; Ford & Stangor, 1992; Martin, 1987).

Guided by stereotypes you assign the same features to all members of a group and save yourself the trouble of noticing a different personality in each individual (Allport, 1954). In the early literature on the subject, stereotypes were generally condemned as excessively negative, over-generalizing and not corresponding to reality. However, in the later theories a conclusion appeared that stereotypes should not be regarded as morally evil and the people who use them should not be pointed out with an accusing finger. According to the new approach stereotypes are equated with the characteristics attributed to a particular social group without their evaluation (Stephan & Stephan, 2007).

Literature on the subject provides hundreds of definitions of the term stereotype (Reszke, 1998; Spencer-Rodgers, 2001). Differences in perceptions are conditioned by, among others, the kind of scientific discipline which the author of the definition represents (Countant et al., 2001). Psychologists generally understand the stereotype as „a schematic image of the representatives of a particular social group” (Kofta & Sędek, 1999), which reflects the traditional approach to stereotypes in social psychology – stereotypes are treated as „generalization relating to a group in which identical characteristics are assigned to all its members without any exceptions, regardless of the real differences between them” (Aronson et al., 1997). In socio-cultural approach stereotypes are defined as „a collection of information about social groups, widespread among the members of a particular culture” (Macrae et al., 1999). However, in common usage, stereotype is „functioning in social awareness, simplified, shortened and colored by assessment picture of reality referring to groups, individuals, institutions, fixed by multiple repetitions” (Smolski et al., 1999). For some time now stereotypes are treated as a kind of „cultural cliché” (Hill, 2004), reflecting well-established attitudes and prejudices with roots reaching deep into the collective subconscious and conducive to deepening inter-group animosities and conflicts with ethnic, racial or religious background (Gawarkiewicz, 2011).

Stereotypes arise as a result of the mindless adoption of opinions widespread in the environment. Because their content is always tinged with assessment and emotions, the stereotype may transmit both sympathy and approval, as well as prejudice, disapproval or antipathy (Smolski et al., 1999) and therefore constitute value judgements (Kotler et al., 1999). This is a kind of historical scheme, in large part created and repeated by the media, literature or events and based on the behavior of individuals so expressive that their characteristics are assigned to others (Macrae, 1991). The risk of reality perception through a prism of stereotypes is associated with the fact that they are also a tool for achieving growth in cognitive control over the social environment and that they reduce cognitive processes as far as to complete freedom from thinking (Łukaszewski & Weigl, 2001) – construct and constitute the social universum (Berger & Luckmann, 2010), because by assigning the same features to all members of the group you save yourself the trouble of perceiving different personality in each individual (Allport, 1954).

The main functions of stereotypes can include a cognitive function (expressed in the tendency to simplification and economization through selection and reducing information overload), adaptive (for quick orientation in the world, facilitating prediction of the other people behavior and selection of the most appropriate behavior), social (involving the defense and strengthening of the values accepted by a given community) and emotional (which implies a rationalization of hostile attitudes and aggression against different groups and justifying a higher sense of value and self-assessment of our own group) (Gawarkiewicz, 2011; Ruble & Zhang, 2013).
functions enable (Budyta-Budzyńska, 2010):

- organization of the social world image – when certain categories are separated within the social reality, each encountered individual belonging to a particular category is perceived through the characteristics of this category (Tajfel, 1981; Tajfel & Turner, 1986),
- creation and preservation of one’s image and our own group – by indicating negative characteristics of others we boost our self-esteem and justify our own status,
- rationalization of prejudice and excuse of discrimination – we do not like certain people because they belong to groups undeserving sympathy, viewed through a negative stereotype;
- determining the conditions of social balance – rules of discrete exclusion, acceptance and tolerance,
- creation and strengthening of national identity in the group – using national stereotypes of foreign groups, own national identity is built on the principle of the opposition.

The concept of national stereotype is closely linked with the image of the nation. Sometimes these terms are even used interchangeably, which is not correct because of their connotative and denotative scope. National stereotype is a narrower concept which relates to a set of personal attributes in semantic memory associated with the name of a nation (Gorbaniuk, 2009). National stereotypes can be defined as shared beliefs about the characteristics of a representative of a particular nation (Terracciano et al., 2005). Thinking about other nations most people would probably say that, for example, the Americans really cherish financial success, while for the Japanese - their attachment to tradition and social harmony are important and for the Scandinavians – honesty and modesty (Lönqvist et al., 2012).

In the twentieth century, there was the view that national stereotypes, similar to gender (Swim, 1994), race (McCauley & Stitt, 1978; Ryan, 2002; Jussim, 2012) or age stereotypes (Costa et al., 2001; Chan et al., 2012) include a “grain of truth” (Allport, 1978/1954; Brigham, 1971), but recent results studies do not seem to confirm that (Terracciano et al., 2005; Lönqvist et al., 2012; McGrae et al., 2013) and there is a view that the stereotypes related to perception of different nations do not reflect the real truth about these nations.

2. RESEARCH METHODS

The aim of the study was to determine whether the Podlasie entrepreneurs think about neighboring nations (Belarusian, Lithuanian, Ukrainian and Russian) in a stereotypical way (assigning them certain negative characteristics) and, if it affects in any way the decision about cooperation.

Quantitative research using a questionnaire was chosen due to the necessity to reach a large number of respondents (Babbie, 2005; Dyduch, 2011). The questionnaire was anonymous in order to obtain more sincere answers (Sztumpski, 2010). The pilot study was carried-out on the turn of 2013 and 2014.

The main part focuses on the negative characteristics, potentially discouraging cooperation. 24 features were selected: backwardness, dishonesty, indiscipline, lack of self-confidence, lack of creativity, lack of perspective thinking, lack of innovativeness, excessive belay, impatience, poverty, greed, avarice, laziness, cunning, prone to theft, resort to violence, distrust, keeping promises, vindictiveness, falsity, hypocrisy, lack of communication, lack of standards of behavior and maladjustment to Polish standards of behavior. These features were extracted based on a critical analysis of the literature with particular emphasis on J. Bluszkowski’s publication.

Respondents were asked to decide to what extent particular characteristic applied to the Russians, Belarusians, Lithuanians and Ukrainians (on a scale of 1 to 5, where 1 – strongly disagree, 2 – disagree, 3 – neither agree, nor disagree, 4 – agree, 5 – strongly agree). At the same time the respondents decided about the extent to which a particular feature is important to them when making decisions about business cooperation (on a scale of 1 to 5, where: 1 – negligible feature; 2 – unimportant feature; 3 – feature of the average importance; 4 – important feature; 5 – very important feature) and whether any of these features exclude cooperation with a supplier, customer or cooperator.

Tabular data presentation and descriptive statistics proved to be useful to analyze the results. Thanks to them the following was specified: how were the individual categories distributed in the research sample and what was the relation of the answers given to a specific variant to all of the answers.
3. CHARACTERISTICS OF THE RESEARCH SAMPLE

The research was carried out on a sample of 200 Podlasie companies. Random selection was used in the sample, a condition for participation in the study was to have the headquarters in the province of Podlasie. The vast majority of the studied companies belonged to the group of micro-enterprises, only slightly more than 1/3 of the enterprises employed more than 9 persons, as illustrated in figure 1.

The period of company activity on the market, in the vast majority, exceeded five years, only a few companies were on the market less than a year, which is illustrated by Fig. 2.

The studied companies in a dominant part declared their business activity on the local market – 32%, but up to a quarter of the researched companies operated on the international market (Fig. 3), which is caused most likely by location of the Podlaskie region in close proximity to other countries.

The important issue from the point of view of the object of study was also cooperation with Lithuania, Ukraine, Belarus and Russia (past, current, and declared in a perspective of next 3 years), which is illustrated in Fig. 4.

Chart analysis leads to the conclusion that most companies (1/4) declared its cooperation with Ukraine and it is the only country where you can see a clear upward trend (however, it should be reminded that the survey was carried-out on the turn of the years 2013/2014, when Ukraine’s situation in the international arena was different). For other countries, there was a slight decrease in co-operation with regard to the past, but at the same time declarations regarding future cooperation were optimistic taking into account all the neighboring countries.

When the continuity of the declared cooperation in the past, the present and the nearest future is analysed the greatest loyalty to Lithuania can be noticed. 22% of studied companies cooperated and cooperates with the Lithuanians and 23% work and intend to work with them in the future. For other countries, similar declarations were made by fewer respondents – the least of companies maintained continuity of cooperation with Ukraine, which is illustrated in Fig. 5.

4. ANALYSIS OF THE RESEARCH RESULTS

When the degree of importance of different characteristics significant to start business cooperation was analysed, it was noticed that the majority of them (54%) were considered to be of high importance (Tab. 1). The respondents considered very important the following characteristic: dishonesty, prone to theft, resort to violence, not keeping promises, vindictiveness, falsity and lack of communication, whereas important were: backwardness, lack of discipline, lack of perspective thinking, lack of innovativeness, greed, laziness, cunning and hypocrisy. Other characteristics were
considered to be of moderate importance, none of
them has been determined as unimportant or
irrelevant when starting cooperation.

Respondents also declared whether the
characteristic precludes starting any business
cooperation (in regard to a supplier, a customer or
a cooperator). Despite indicating many characteristics
as essential when starting business cooperation, only
a few have been identified as preventing cooperation.
Two characteristics: dishonesty and prone to theft
exclude cooperation in regard to a supplier,
a customer and a cooperator; not keeping promises
prevent starting cooperation with a supplier and
a cooperator, but does not apply to cooperation with
a client; while cunning makes it impossible to
cooperate with a client. Other characteristics
considered at least important in making decisions
about cooperation did not determine its exclusion.

The survey also asked if the
aforementioned traits characterise the
neighbouring nations. This is illustrated
in table 2 (although it is worth noting
that the table includes only those traits
for which in at least one country the
dominant answer was other than
„neither agree nor disagree“).

Analysis of the respondents’ answers
does not allow the conclusion that the
studied entrepreneurs from Podlasie
are guided by negative national
stereotypes in relation to neighbouring
countries. In respect to none of the
characteristics, the analysis of
indications shows that the trait
definitely relates to any of the nations
(also in respect to any of the traits
definite disagreement was indicated).
The majority of respondents marked
the safest answer – „neither agree nor
disagree“.

In relation to the Russians seven
characteristics were negated, in relation
to the Belarusians two traits, and for
Lithuanians eight characteristics – it
can therefore be concluded that the
respondents had no negative
associations with these nations. The
biggest neutrality can be seen in the
evaluation of the Ukrainian nation –
the respondents could not agree with
the presence or absence of any of the
given characteristics.

It was also analyzed if there were
differences in the perception of these
nations through the lens of label traits
– special attention was paid to the cooperation
undertaken with individual countries, however, there
was no difference observed in the dominant
indications.

### CONCLUSIONS

In the light of literature stereotypes play
a considerable role in shaping attitudes, opinions and
decision making. Because creation of cross-border
cooperation seems to be important for the
development of Podlaskie Province the subject of
research was the attitude of Podlasie entrepreneurs to
the neighboring nations – the study concerned the
negative traits that the Poles attribute to their eastern neighbors, and whether these traits can influence decisions about cooperation.

The results of the study proved to be quite optimistic. Comparing the gathered opinions with the research carried out by Błuszkowski (2005), the opinions of Poles from Podlaskie Province on the perception of nations across the East borders are more neutral (according to Błuszkowski’s researches). Referring to the traits which were studied in both cases, Błuszkowski’s study showed that all four countries are perceived as poor and backward. In addition, the Russians, Belarusians and Ukrainians are seen as lazy and undisciplined, and the Russians and Ukrainians as dishonest.

The differences in perception can have various causes – primarily the presented research was merely a pilot study and the sample cannot be considered representative, while Błuszkowski’s research was carried out on a broader and more diverse sample, which is of great importance (Rogers & Wood, 2010), and the respondents were not only people who have (or may have) business contacts with representatives of the studied nations. In addition, over the years opinions of the Poles may have changed.

Another reason could be the reluctance of the respondents to disclose their true attitudes due to the fact that their task was to respond only to negative traits (it was done on purpose – because of the respondents’ unwillingness to fill in extensive questionnaires the focus was on the negative traits which might reduce willingness to start (maintain) cooperation.

In conclusion, in the light of the pilot studies the stereotypes referring the perception of listed nations do not seem to be a major barrier in starting cross-

border cooperation, because although the respondents declared that the occurrence of specified traits is an important factor for them to start cooperation, they did not notice these traits in their Eastern neighbours.
