# CONSTRUCTION OF AN INTEGRAL MANIFOLD FOR LINEAR DIFFERENTIAL-DIFFERENCE EQUATIONS

**Abstract.** In this paper we establish sufficient conditions for the existence of an asymptotic integral manifold of solutions of a linear system of differential-difference equations with a small parameter. This integral manifold is described by a linear system of differential equations without deviating argument.

**Keywords:** system with deviating argument, integral manifold of solutions, fundamental matrix, exponential dichotomy.

Mathematics Subject Classification: 34K06.

## 1. INTRODUCTION AND PRELIMINARIES

The theory of linear differential equations with deviating argument is well established. There are numerous important papers on the subject. One of the classical works here is [2]. For a recent account of the theory, we refer the reader to [1] and the references given there.

We consider the linear system of differential equations with deviating argument

$$\frac{dX(t)}{dt} = A(t)X(t) + \mu \sum_{k=1}^{n} (A_k(t)X(t+\tau_k(t)) + B_k(t)Y(t+\tau_k(t)))$$

$$\frac{dY(t)}{dt} = B(t)Y(t) + \mu \sum_{k=1}^{n} (C_k(t)X(t+\tau_k(t)) + D_k(t)Y(t+\tau_k(t))),$$
(1)

where  $t \ge 0$ ,  $\mu$  is a small parameter, dim X(t) = p, dim Y(t) = q,

$$|\tau_k(t)| \le \tau$$
  $(k = 1, \dots, n; t \ge 0).$  (2)

465

We assume that the matrices in System (1) are bounded:

$$\|A(t)\| \le \alpha_0, \quad \sum_{k=1}^n \|A_k(t)\| \le \alpha,$$
  
$$\sum_{k=1}^n \|B_k(t)\| \le \alpha, \quad \sum_{k=1}^n \|C_k(t)\| \le \alpha, \quad \sum_{k=1}^n \|D_k(t)\| \le \alpha,$$
(3)

If the parameter  $\mu = 0$ , System (1) decouples into two independent subsystems. Let the system

$$\frac{dX(t)}{dt} = A(t)X(t)$$

have a fundamental matrix of solutions P(t,s) normalized at t = s and satisfy the condition

$$\|P(t,s)\| \le c_1 e^{\varepsilon|t-s|} \quad (c_1 \ge 1, \ \varepsilon > 0) \tag{4}$$

Let the system

$$\frac{dY(t)}{dt} = B(t)X(t)$$

have a fundamental matrix of solutions Q(t,s) normalized at t = s and satisfy the condition

$$\|Q(t,s)\| \le c_2 e^{\lambda|t-s|} \quad (c_2 \ge 1, \ \lambda > \varepsilon)$$
(5)

Thus, for  $\mu = 0$ , System (1) possesses an exponential dichotomy with an exponent  $\sigma$ , where  $-\lambda < \sigma < -\varepsilon$  (see [3]).

We will construct an integral manifold of solutions of System (1) in the form of ([3,4])

$$\frac{dX(t)}{dt} = H(t,\mu)X(t), \ Y(t) = K(t,\mu)X(t).$$
(6)

Let a fundamental matrix of solutions of System (6) be denoted by  $N(t, s, \mu)$ , it follows that

$$X(t) = N(t, s, \mu)X(s).$$
(7)

From this we obtain

$$X(t + \tau_k(t)) = N(t + \tau_k(t), t.\mu)X(t),$$
  

$$Y(t + \tau_k(t)) = K(t + \tau_k(t), \mu)N(t + \tau_k(t), t, \mu)X(t).$$
(8)

If the solutions of System (6) satisfy (1), then

$$H(t,\mu) = A(t) + \mu \sum_{k=1}^{n} (A_k(t)N(t+\tau_k(t),t,\mu) + B_k(t)K(t+\tau_k(t),\mu)N(t+\tau_k(t),t,\mu))$$
(9)

$$\frac{\partial K(t,\mu)}{\partial t} + K(t,\mu)(A(t) + \mu \sum_{k=1}^{n} (A_{k}(t)N(t + \tau_{k}(t), t, \mu) + B_{k}(t)K(t + \tau_{k}(t), \mu)N(t + \tau_{k}(t), t, \mu))) = B(t)K(t,\mu) + \mu \sum_{k=1}^{n} (C_{k}(t)N(t + \tau_{k}(t), t, \mu) + D_{k}(t)K(t + \tau_{k}(t), \mu)N(t + \tau_{k}(t), t, \mu)).$$
(10)

We now proceed to considering the auxiliary matrix differential equation

$$\frac{\partial K(t,\mu)}{\partial t} = B(t)K(t,\mu) - K(t,\mu)A(t) + F(t), \qquad (11)$$

where  $||F(t)|| \le b$  for  $t \ge 0$ . It is easy to check that the matrix

$$K(t,\mu) = \int_0^t Q(t,s)F(t)P(s,t)ds$$
(12)

is a solution of (11). In addition, under conditions (4) and (5), we obtain

$$\|K(t,\mu)\| = c_1 c_2 \int_0^t e^{-\lambda(t-s)} \sup \|F(t)\| e^{\varepsilon(t-s)} \le \frac{c_1 c_2}{\lambda - \varepsilon} \sup \|F(t)\|, \ t \ge 0.$$
(13)

Application of (11) and (12) enables us to write System (10) in the form

$$K(t,\mu) = \mu \int_0^t Q(t,s) \sum_{k=1}^n (C_k(s) + D_k(s)K(s + \tau_k(s),\mu) - K(s,\mu)A_k(s) - K(s,\mu)B_k(s)K(s + \tau_k(s),\mu))N(s + \tau_k(s),t,\mu)P(s,t)ds.$$
(14)

Our purpose here is to give a proof that an integral manifold of solutions of System (1) exists in form (6).

### 2. SUCCESSIVE APPROXIMATIONS

System (9),(14) of matrix equations defines the matrices  $H(t,\mu)$ ,  $K(t,\mu)$  and it can be solved by the method of successive approximations. We start this process by letting  $H_0(t,\mu) = 0$ ,  $K_0(t,\mu) = 0$  and

$$H_{j+1}(t,\mu) = A(t) + \mu \sum_{k=1}^{n} (A_k(t)N_j(t+\tau_k(t),t,\mu) + B_k(t)K_j(t+\tau_k(t),\mu)N_j(t+\tau_k(t),t,\mu)),$$

$$K_{j+1}(t,\mu) = \mu \int_0^t Q(t,s) \sum_{k=1}^{n} (C_k(s) + D_k(s)K_j(s+\tau_k(s),\mu) - K_j(s,\mu)A_k(s) - K_j(s,\mu)B_k(s)K_j(s+\tau_k(s),\mu)) \times N_j(s+\tau_k(s),t,\mu)P(s,t)ds,$$
(15)

for j=0,1,2,...

Let  $N_j(t, s, \mu)$  be a fundamental matrix of solutions of the system

$$\frac{dX(t)}{dt} = H_j(t,\mu)X(t) \quad (j=0,1,2,\ldots).$$
(16)

Supposing that the inequalities

$$||H_j(t,\mu)|| \le h_j, ||K_j(t,\mu)|| \le k_j$$

take place, we find the estimates

$$||N_j(t,s,\mu)|| \le e^{h_j|t-s|}, ||N_j(t+\tau_k(t),t,\mu)|| \le e^{\tau h_j}.$$

And owing to System (15) it follows that

$$h_{j+1} \le \alpha_0 + |\mu| \,\alpha (1+k_j) e^{\tau h_j}, k_{j+1} \le |\mu| \,\alpha \beta (1+k_j)^2 e^{\tau h_j},$$
(17)

where

$$\beta \equiv \frac{c_1 c_2}{\lambda - \varepsilon}$$

In order for the sequences  $\{h_j\}$  and  $\{k_j\}$  to be bounded from below, i.e.

 $h_j \ge h > 0, \ k_j \ge k > 0, \ j = 0, 1, 2, \dots$ 

it is necessary and sufficient that the system of nonlinear equations

$$\alpha_0 + |\mu| \,\alpha(1+k)e^{\tau h} = h, \quad |\mu| \,\alpha\beta(1+k)^2 e^{\tau h} = k \tag{18}$$

has a positive solution.

We need to find the largest value  $\mu = \mu_0$  for which System (18) has multiple solutions. In this connection h and k achieve the maximum. We obtain

$$\mu_{0} = \frac{2(\tau + \sqrt{\tau^{2} + 4\beta^{2}})}{\alpha(\tau + 2\beta + \sqrt{\tau^{2} + 4\beta^{2}})} \exp\left\{-\tau(\alpha + \frac{2}{\tau + 2\beta + \sqrt{\tau^{2} + 4\beta^{2}}})\right\}$$
(19)  
$$h = \alpha_{0} + \frac{k}{\beta(1+k)}, \quad k = \frac{2\beta}{\tau + \sqrt{\tau^{2} + 4\beta^{2}}}.$$

It follows that for  $|\mu| \leq \mu_0$  the sequences of matrices  $H_j(t,\mu)$  and  $K_j(t,\mu)$ (j=0,1,2,...) are well defined and bounded in norm for  $t \geq 0$ .

#### 3. CONVERGENCE

Let us turn to prove that the sequences of matrices  $H_j(t,\mu)$  and  $K_j(t,\mu)$  (j = 0, 1, 2, ...) converge uniformly in t, for  $t \ge 0$ . Let us introduce the notation

$$||H_j(t,\mu) - H_{j-1}(t,\mu)|| \le u_j, ||K_j(t,\mu) - K_{j-1}(t,\mu)|| \le v_j \ (j=1,2,3,\ldots).$$

Then from System (15), for  $\mu = \mu_0$  there follows:

$$u_{j+1} \le \ell (1+k)\tau u_j + lv_j, v_{j+1} \le \ell \beta \tau (1+k)^2 u_j + 2\ell \beta (1+k)v_j,$$
(20)

469

where

$$\ell \equiv \frac{1}{2\beta(1+k) + \tau}.$$

The matrix of coefficients of the expression on the right hand side of (20)

$$R(\mu) = \begin{pmatrix} \ell \tau (1+k) & \ell \\ \ell \beta \tau (1+k)^2 & 2\ell\beta \end{pmatrix}$$

has the largest eigenvalue (in terms of the absolute value)

$$\rho_{max} = \frac{(2\beta + \tau + \sqrt{\tau^2 + 4\beta^2})^2}{2(2\beta + \sqrt{\tau^2 + 4\beta^2})(\tau + \sqrt{\tau^2 + 4\beta^2})} \equiv 1.$$

For  $|\mu| < \mu_0$ , the absolute values of eigenvalues of the matrix  $R(\mu)$  are less than 1 and, therefore, the terms of the series

$$H(t,\mu) = \sum_{j=0}^{\infty} \left( H_{j+1}(t,\mu) - H_j(t,\mu) \right),$$
(21)

$$K(t,\mu) = \sum_{j=0}^{\infty} \left( K_{j+1}(t,\mu) - K_j(t,\mu) \right).$$
(22)

are bounded from above by the terms of the decreasing geometric progression. It follows that series (21) and (22) converge uniformly for  $|\mu| \leq \mu_1 < \mu_0$ .

We can now formulate our main results.

**Theorem 3.1.** Let System (1) of differential-difference equations be dichotomic for  $\mu = 0$  and  $t \ge 0$ , caused by inequalities (4) and (5). If conditions (2) and (3) hold, then System (1) has an integral manifold of form (6), where the matrices H and K depend analytically on  $\mu$ , provided  $|\mu| < \mu_0$ , where  $\mu_0$  is given by (19).

The construction of integral manifolds in form (6) for systems of differential- difference equations can be used in the investigation of qualitative properties of this systems.

Example 3.2. For the delay system

$$\frac{dx(t)}{dt} = \mu \cos tx(t) + \mu ay(t-\tau),$$

$$\frac{dy(t)}{dt} = -y(t) + \mu bx(t-\tau),$$
(23)

we are interested in the construction of an integral manifold of solutions in form (6)

$$\frac{dx(t)}{dt} = h(t,\mu)x(t), \quad y(t) = k(t,\mu)x(t).$$

The functions k and h are defined by the system

$$h(t,\mu) = \mu \cos t + \mu a k(t-\tau,\mu) \exp \int_{t}^{t-\tau} h(r,\mu) dr,$$
  

$$k(t,\mu) = \mu \int_{0}^{t} (e^{-(t-s)}(b-k(s,\mu)) \cos s - (24)) -ak(s,\mu)k(s-\tau,\mu) \exp \int_{s}^{s-\tau} h(r,\mu) dr) ds.$$

Solving System (24) by the method of successive approximations, we find

$$h(t,\mu) = \mu \cos t + \mu^2 ab + O(\mu^3).$$

The zero solution of the differential equation

$$\frac{dx(t)}{dt} = (\mu\cos t + \mu^2 ab + O(\mu^3))x(t)$$

and also the zero solution of System (23) are asymptotically stable for a sufficiently small values of  $\mu > 0$  and ab < 0, and unstable if ab > 0.
